

**SOME STRONG COMPARISON PRINCIPLES AND  
CONVERGENCE THEOREMS IN THE CAPACITY AND THE  
DIRICHLET PROBLEM IN THE CLASS  $\mathcal{F}_p(h)$**

LE MAU HAI AND TANG VAN LONG

ABSTRACT. The aim of this paper is to establish the strong comparison principle of Xing type ([Xi1], [Xi2]) for the classes  $\mathcal{E}_p$  and  $\mathcal{F}_p$ . As an application of the obtained results, we investigate the convergence in the capacity of the complex Monge-Ampère operator for the class  $\mathcal{F}_p$  as well as solve the Dirichlet problem in the class  $\mathcal{F}_p(h)$ .

1. INTRODUCTION

After constructing the complex Monge-Ampère operator on the class of locally bounded plurisubharmonic functions Bedford and Taylor have proved the comparison principle for the class of bounded plurisubharmonic functions on a bounded domain  $\Omega$  in  $\mathbb{C}^n$  (see Theorem 4.1 in [Bed-Ta2]). Recently, after introducing and investigating many essential results for the classes  $\mathcal{E}_p$  and  $\mathcal{F}_p$ , Cegrell (see [Ce2]) established this principle for the class  $\mathcal{F}_p$ . However, in 1996 and 2000 Xing proved a stronger inequality than the comparison principle first for the class of bounded psh functions and next for psh functions in the class  $\mathcal{B}$  (see [Xi1], [Xi2]). In this paper we first prove the inequality of Xing type for the classes  $\mathcal{E}_p$  and  $\mathcal{F}_p$ . Next, we apply the obtained results to investigate the weak convergence in the capacity for the complex Monge-Ampère operator on the class  $\mathcal{F}_p$  and to solve the Dirichlet problem in the class  $\mathcal{F}_p(h)$ .

2. SOME NOTIONS

In this section we recall some definitions and results concerning the classes  $\mathcal{E}_p$  and  $\mathcal{F}_p$  introduced and investigated by Cegrell (see [Ce2], [Ce3]).

2.1. Let  $\Omega$  be a hyperconvex domain in  $\mathbb{C}^n$ . By  $\mathcal{E}_0 = \mathcal{E}_0(\Omega)$  we denote the class of negative and bounded psh functions  $\varphi$  on  $\Omega$  such that  $\lim_{z \rightarrow \xi} \varphi(z) = 0 \forall \xi \in \partial\Omega$  and  $\int_{\Omega} (dd^c \varphi)^n < \infty$ .

For each  $p \geq 1$ , by  $\mathcal{E}_p = \mathcal{E}_p(\Omega)$  we denote the class of psh functions  $\varphi$  on  $\Omega$  such that there exists a sequence  $\{\varphi_j\} \subset \mathcal{E}_0$  with  $\varphi_j \downarrow \varphi$ ,  $j \rightarrow \infty$ , and

$$\sup_j \int_{\Omega} (-\varphi_j)^p (dd^c \varphi_j)^n < \infty.$$

If also  $\varphi_j$  can be chosen so that  $\sup_j \int_{\Omega} (dd^c \varphi_j)^n < \infty$  then we say that  $\varphi \in \mathcal{F}_p = \mathcal{F}_p(\Omega)$ .

In [Ce2] Cegrell showed that  $\mathcal{E}_0 \subset \mathcal{F}_p \subset \mathcal{E}_p$  and  $\mathcal{F}_q \subset \mathcal{F}_p$  if  $q > p$ .

2.2. By Theorem 3.5 in [Ce2] it follows that the operator  $(dd^c)^n$  is well-defined on the class  $\mathcal{E}_p$ . Moreover, Theorem 3.7 in [Ce2] says that if  $\{u_j\} \subset \mathcal{E}_p$  and  $u_j \uparrow u$ ,  $j \rightarrow \infty$ , then  $u \in \mathcal{E}_p$  and  $(dd^c u_j)^n$  converges weakly to  $(dd^c u)^n$ . Another result of Pesson showed that if  $\{u_j\}$ ,  $u$  are in  $\mathcal{E}_p$  and  $u_j \downarrow u$  then  $(dd^c u_j)^n \rightarrow (dd^c u)^n$  weakly (see Corollary 3.8 in [Per]).

2.3. Next we deal with the comparison principle for the class  $\mathcal{F}_p$ . As in [Ce2] Cegrell proved that if  $u, v \in \mathcal{F}_p$  and  $u \leq v$  on  $\Omega$  then

$$\int_{\Omega} (dd^c u)^n \geq \int_{\Omega} (dd^c v)^n.$$

Moreover, Lemma 4.4 in [Ce2] claims that if  $u, v \in \mathcal{F}_p$  then

$$\int_{\{u < v\}} (dd^c v)^n \leq \int_{\{u < v\}} (dd^c u)^n.$$

From the above results it follows that the comparison principle is valid for the  $\mathcal{F}_p$ . Namely, if  $u, v \in \mathcal{F}_p$  and  $(dd^c u)^n \leq (dd^c v)^n$  then  $u \geq v$  on  $\Omega$  (see Theorem 4.5 [Ce2]).

2.4. Now we recall the notions about the convergence in  $C_n$ -capacity and the uniform absolute continuity in  $C_n$ -capacity and the uniform absolute continuity of a sequence of measures with respect to  $C_n$  in a domain  $\Omega$  in  $\mathbb{C}^n$ .

Let  $C_n$  be the inner capacity given by Bedford-Taylor in [Be-Ta2], as defined by

$$C_n(E) = C_n(E, \Omega) = \sup \left\{ \int_E (dd^c u)^n : u \in PSH(\Omega), 0 < u < 1 \right\}$$

for any Borel subset  $E$  of  $\Omega$ . A sequence of functions  $\{u_j\}$  is said to converge to a function  $u$  in  $C_n$ -capacity on a set  $E \subset \Omega$  if for each  $\delta > 0$  we have

$$\lim_{j \rightarrow \infty} C_n(\{z \in E : |u_j(z) - u(z)| \geq \delta\}) = 0.$$

A sequence of positive Borel measures  $\{\mu_j\}$  is said to be uniformly absolutely continuous with respect to  $C_n$ -capacity in  $\Omega$  (briefly  $\mu_j \ll C_n$  in  $\Omega$ ) if for each  $\varepsilon > 0$  there exists  $\delta > 0$  such that for each Borel set  $E \subset \Omega$  with  $C_n(E) < \delta$  the inequality  $\mu_j(E) < \varepsilon$  holds for all  $j > 1$ . For details concerning properties of  $C_n$ -capacity and the convergence in  $C_n$ -capacity as well as the uniform absolute continuity of a sequence of positive measures with respect to  $C_n$ -capacity we refer to the papers of Bedford-Taylor [Be-Ta2] and Xing [Xi2].

2.5. Now we deal with the classes  $\mathcal{F}_p(h)$  and  $\mathcal{E}_p(h)$  introduced and investigated in [Ce2]. Let  $\Omega$  be a bounded hyperconvex domain in  $\mathbb{C}^n$  and  $h \in C(\partial\Omega)$ . Put

$$U(0, h)(z) = \sup \left\{ v(z) : v \in PSH(\Omega) \cap L_{\text{loc}}^\infty(\Omega), \overline{\lim}_{z \rightarrow \xi} v(z) \leq h(\xi), \forall \xi \in \partial\Omega \right\}.$$

Then from [Ce-Ko] it follows that  $U(0, h) \in PSH \cap L_{\text{loc}}^\infty(\Omega)$  and  $\overline{\lim}_{z \rightarrow \xi} U(0, h)(z) \leq h(\xi)$ ,  $\forall \xi \in \partial\Omega$ .

Now as in [Ce2] we consider functions  $h \in C(\partial\Omega)$  such that  $\lim_{z \rightarrow \xi} U(0, h)(z) = h(\xi)$ ,  $\forall \xi \in \partial\Omega$ . For such functions we denote by  $\mathcal{F}_p(h)$  (resp.  $\mathcal{E}_p(h)$ ),  $p \geq 1$ , the class of plurisubharmonic functions  $u$  such that there exists  $\varphi \in \mathcal{F}_p$  (resp.  $\mathcal{E}_p$ ) with  $U(0, h) \geq u \geq \varphi + U(0, h)$ . By Theorem 7.2 in [Ce2] we know that  $(dd^c \cdot)^n$  is well-defined on  $\mathcal{F}_p(h)$ . A recent result of P.Ahag (see Theorem 4.11 in [Ah]) implies that  $(dd^c \cdot)^n$  is well-defined on  $\mathcal{E}_p(h)$ .

2.6. Finally we recall the class  $\mathcal{E}$  introduced and investigated by Cegrell (see [Ce3]) recently. Let  $u$  be a negative psh function on a hyperconvex domain  $\Omega$ . We say that  $u \in \mathcal{E} = \mathcal{E}(\Omega)$  if for every  $z_0 \in \Omega$  there exists a neighbourhood  $\omega$  of  $z_0$  in  $\Omega$  and a decreasing sequence  $h_j \in \mathcal{E}_0$  such that  $h_j \downarrow u$  on  $\omega$  and  $\sup_j \int_{\Omega} (dd^c h_j)^n < \infty$ .

In [Ce3] Cegrell showed that if  $u \in \mathcal{E}$  then  $(dd^c u)^n$  is well-defined and  $PSH^- \cap L_{\text{loc}}^\infty(\Omega) \subset \mathcal{E}$  (see Definition 4.2 and the remark after Theorem 4.5 in [Ce3]).

### 3. THE STRONG COMPARISON PRINCIPLE FOR THE CLASSES $\mathcal{E}_p$ AND $\mathcal{F}_p$

As we say in the introduction of this paper, one of the main purposes of this paper is to establish the strong comparison principle for the classes  $\mathcal{E}_p$  and  $\mathcal{F}_p$ . First, the following result shows that the strong comparison principle holds for the class  $\mathcal{E}_p$ .

**Theorem 3.1.** *Let  $\Omega$  be a bounded hyperconvex domain in  $\mathbb{C}^n$  and  $u, v \in \mathcal{E}_p$ ,  $p \geq 1$ , with  $\underline{\lim}_{z \rightarrow \xi} (u(z) - v(z)) \geq 0$ ,  $\forall \xi \in \partial\Omega$ . Then for all  $r \geq 1$  and  $w_j \in PSH(\Omega)$ ,  $0 \leq w_j \leq 1$ ,  $1 \leq j \leq n$ , the inequality*

$$\frac{1}{(n!)^2} \int_{\{u < v\}} (v-u)^n dd^c w_1 \wedge \dots \wedge dd^c w_n + \int_{\{u < v\}} (r-w_1)(dd^c v)^n \leq \int_{\{u < v\}} (r-w_1)(dd^c u)^n$$

*holds. Therefore, under the additional assumption  $(dd^c v)^n \geq (dd^c u)^n$  in  $\Omega$  we obtain that  $u \geq v$  in  $\Omega$ .*

The proof of Theorem 3.1 is based on the following lemmas.

**Lemma 3.1.** *Let  $\Omega$  be a bounded hyperconvex domain in  $\mathbb{C}^n$  and  $u \in \mathcal{E}_p$ ,  $p \geq 1$ . Then  $\lim_{c \rightarrow +\infty} c^n C_n(\{u < -c\}, \Omega) = 0$ .*

*Proof.* Let  $\mathcal{E}_0 \ni u_k \downarrow u$  be as in the definition of  $\mathcal{E}_p$  satisfying the condition

$$\alpha = \sup_k \int_{\Omega} (-u_k)^p (dd^c u_k)^n < \infty.$$

Then for  $c > 0$  we have

$$\{u_k < -c\} \uparrow \{u < -c\}$$

and

$$\{u < -c\} = \bigcup_{k \geq 1} \{u_k < -c\}.$$

Proposition 3.2 in [Be-Ta2] yields

$$C_n(\{u < -c\}, \Omega) = \lim_{k \rightarrow \infty} C_n(\{u_k < -c\}, \Omega).$$

Let  $w \in PSH(\Omega)$ ,  $0 \leq w \leq 1$ , be arbitrary. From Lemma 1 in [Xi1] we get the following estimations

$$\begin{aligned} \int_{\{u_k < -c\}} (dd^c w)^n &\leq \int_{\{u_k < -c\}} \left(-1 - \frac{2u_k}{c}\right)^n (dd^c w)^n \\ &\leq \frac{2^n}{c^n} \int_{\{u_k < -\frac{c}{2}\}} \left(-\frac{c}{2} - u_k\right)^n (dd^c w)^n \\ &\leq \frac{(n!)^2 \cdot 2^n}{c^n} \int_{\{u_k < -\frac{c}{2}\}} (1-w)(dd^c u_k)^n \\ &\leq \frac{(n!)^2 \cdot 2^{n+p}}{c^{n+p}} \int_{\Omega} (-u_k)^p (dd^c u_k)^n \\ &\leq \frac{(n!)^2 \cdot 2^{n+p} \cdot \alpha}{c^{n+p}}. \end{aligned}$$

Hence, for all  $k \geq 1$ ,

$$C_n(\{u_k < -c\}) \leq \frac{(n!)^2 \cdot 2^{n+p} \cdot \alpha}{c^{n+p}}$$

and, consequently,

$$C_n(\{u < -c\}) = \lim_{k \rightarrow \infty} C_n(\{u_k < -c\}) \leq \frac{(n!)^2 \cdot 2^{n+p} \cdot \alpha}{c^{n+p}}$$

and the desired conclusion follows.  $\square$

**Lemma 3.2.** *Let  $u_j \in PSH(\Omega) \cap L^\infty(\Omega)$ ,  $u_j \downarrow u$  on  $\Omega$ , where  $u \in \mathcal{E}$ . Assume that  $\lim_{s \rightarrow \infty} s^n C_n(\{u < -s\}) = 0$ . Then  $(dd^c u_j)^n$  is uniformly absolutely continuous with respect to  $C_n$ -capacity.*

*Proof.* Without loss of generality we may assume that  $u_j \leq 0, \forall j \geq 1$ . By [Ce3] for each  $j \geq 1, \exists u_j^k \in \text{PSH} \cap C(\bar{\Omega}), u_j^k \downarrow u_j$  as  $k \rightarrow \infty$  and  $u_j^k|_{\partial\Omega} = 0$ . As in [Ce Ko Ze] for  $s > 0$  put

$$\begin{aligned}\Omega_{kj}(s) &= \{u_j^k < -s\}, \quad \Omega_j(s) = \{u_j < -s\}, \quad \Omega(s) = \{u < -s\}, \\ a_{kj}(s) &= C_n(\Omega_{kj}(s)), \quad a_j(s) = C_n(\Omega_j(s)), \quad a(s) = C_n(\Omega(s)), \\ b_{kj}(s) &= \int_{\Omega_{kj}(s)} (dd^c u_j^k)^n, \quad b_j(s) = \int_{\Omega_j(s)} (dd^c u_j)^n, \quad b(s) = \int_{\Omega(s)} (dd^c u)^n.\end{aligned}$$

For  $0 < s < t$  we have  $\max(u_j^k, -t) = u_j^k$  on  $\{u_j^k > -t\}$ , an open neighbourhood of  $\partial\Omega_{kj}(s)$ . Then

$$a_{kj}(s) \geq t^{-n} \int_{\Omega_{kj}(s)} (dd^c \max(u_j^k, -t))^n = t^{-n} \int_{\Omega_{kj}(s)} (dd^c u_j^k)^n,$$

where the second equality follows from Lemma 4.1 in [Ce2]. Now if  $t$  tends to  $s$ , we get

$$(1) \quad s^n a_{kj}(s) \geq \int_{\Omega_{kj}(s)} (dd^c u_j^k)^n, \quad \forall k, j \geq 1, \quad \forall s > 0.$$

Given  $\varepsilon > 0$ . By the hypothesis there exists  $s_0 > 0$  such that

$$(2) \quad s_0^n a(s_0) < \varepsilon.$$

Let  $E \subset \Omega$  be a Borel set with  $C_n(E) < \frac{\varepsilon}{s_0^n}$ . Take an open neighbourhood  $G$  of  $E$  such that  $C_n(G) < \frac{\varepsilon}{s_0^n}$ . It follows that

$$\begin{aligned}\int_E (dd^c u_j)^n &\leq \int_G (dd^c u_j)^n \leq \liminf_k \int_G (dd^c u_j^k)^n \\ &\leq \liminf_k \left[ \int_{\Omega_{kj}(s_0)} (dd^c u_j^k)^n + \int_{G \setminus \Omega_{kj}(s_0)} (dd^c u_j^k)^n \right] \\ &\leq \liminf_k [s_0^n a_{kj}(s_0) + s_0^n C_n(G)] \leq s_0^n a(s_0) + \varepsilon < 2\varepsilon \quad \forall j \geq 1.\end{aligned}$$

Hence,  $(dd^c u_j)^n$  is uniformly absolutely continuous in  $\Omega$ .  $\square$

**Lemma 3.3.** *Let  $u \in \mathcal{E}_p$  and  $u_j \in \mathcal{E}_0, u_j \downarrow u$  as in the definition of the class  $\mathcal{E}_p$ . Then for every bounded psh function  $\omega$  on  $\Omega$  the sequence  $\{\omega(dd^c u_j)^n\}$  converges weakly to  $\omega(dd^c u)^n$ .*

*Proof.* Without loss of generality we may assume that  $-1 \leq \omega \leq 0$  on  $\Omega$ . Given  $\varphi \in C_0(\Omega)$ . We can assume that  $\sup\{|\varphi(z)| : z \in \Omega\} \leq 1$ . Since  $\omega$  is quasi-continuous (see [Bed-Ta2]), from Lemma 3.2 it follows that for each  $\varepsilon > 0$  there

exists an open subset  $G \subset \Omega$  such that  $\omega$  is continuous on  $F = \Omega \setminus G$  and

$$(3) \quad \sup_j \int_G (dd^c u_j)^n < \varepsilon.$$

Take a continuous function  $h$  on  $\Omega$  such that  $h = \omega$  on  $F$ . Since  $\{(dd^c u_j)^n\}$  converges weakly to  $(dd^c u)^n$  (see Theorem 3.5 in [Ce2]) it follows that there exists  $j_0$  such that for  $j > j_0$  we have

$$\left| \int_{\Omega} \varphi h (dd^c u_j)^n - \int_{\Omega} \varphi h (dd^c u)^n \right| < \varepsilon.$$

On the other hand, since  $G$  is open, by (3) we have

$$\left| \int_G \varphi \omega (dd^c u)^n \right| \leq \int_G (dd^c u)^n \leq \varliminf_j \int_G (dd^c u_j)^n < \varepsilon.$$

Similarly,

$$\left| \int_G \varphi h (dd^c u)^n \right| \leq M \int_G (dd^c u)^n \leq M \varliminf_j \int_G (dd^c u_j)^n < M\varepsilon$$

where  $M = \sup\{|h(z)| : z \in \text{supp } \varphi\}$ .

Because  $h = \omega$  on  $F$  then for  $j > j_0$  we have

$$\begin{aligned} & \left| \int_{\Omega} \varphi \omega (dd^c u_j)^n - \int_{\Omega} \varphi \omega (dd^c u)^n \right| \leq \left| \int_{\Omega} \varphi h (dd^c u_j)^n - \int_{\Omega} \varphi h (dd^c u)^n \right| + \\ & + \left| \int_G \varphi \omega (dd^c u_j)^n \right| + \left| \int_G \varphi \omega (dd^c u)^n \right| + \left| \int_G \varphi h (dd^c u_j)^n \right| + \left| \int_G \varphi h (dd^c u)^n \right| \\ & < (2M + 3)\varepsilon. \end{aligned}$$

The lemma is proved.  $\square$

The next lemma is an extension of Lemma 4.3 in [Ce2].

**Lemma 3.4.** *Let  $\omega \in \mathcal{E}_p$  and  $\mathcal{E}_0 \ni u_j \downarrow \omega$  as in the definition of  $\mathcal{E}_p$ . If  $u, v \in PSH(\Omega)$  and  $\varphi \in PSH(\Omega)$ ,  $0 \leq \varphi \leq 1$  and  $r \geq 1$ , then*

$$(4) \quad \int_{\{u < v\}} (r - \varphi)(dd^c \omega)^n \leq \varliminf_j \int_{\{u < v\}} (r - \varphi)(dd^c u_j)^n.$$

*Proof.* Let  $\varepsilon > 0$  be given. Because of the quasi-continuity of  $u$  and  $v$ , repeating the arguments of Lemma 3.3 shows that there exist an open subset  $G \subset \Omega$  and two continuous functions  $\tilde{u}$  and  $\tilde{v}$  on  $\Omega$  such that

$$(5) \quad \{u \neq \tilde{u}\} \cup \{v \neq \tilde{v}\} \subset G \text{ and } \sup_j \int_G (dd^c u_j)^n < \frac{\varepsilon}{r}.$$

Then  $\{u < v\} \subset \{\tilde{u} < \tilde{v}\} \cup G \subset \{u < v\} \cup G$ . Hence, from Lemma 3.3 and (5) it follows that

$$\begin{aligned} \int_{\{u < v\}} (r - \varphi)(dd^c \omega)^n &\leq \int_{\{\tilde{u} < \tilde{v}\} \cup G} (r - \varphi)(dd^c \omega)^n \\ &\leq \varliminf_j \int_{\{\tilde{u} < \tilde{v}\} \cup G} (r - \varphi)(dd^c u_j)^n \\ &\leq \varliminf_j \int_{\{u < v\} \cup G} (r - \varphi)(dd^c u_j)^n \\ &\leq \varliminf_j \int_{\{u < v\}} (r - \varphi)(dd^c u_j)^n + \varepsilon. \end{aligned}$$

Now, if we let  $\varepsilon$  tend to zero and the desired conclusion follows.  $\square$

*Proof of Theorem 3.1.* Instead of  $u$  we consider  $u + 2\delta$ ,  $\delta > 0$ , and notice that  $\{u + 2\delta < v\} \uparrow \{u < v\}$  as  $\delta \downarrow 0$ . Then we may assume that  $\varliminf_{z \rightarrow \partial\Omega} (u(z) - v(z)) \geq 2\delta$  on  $\partial\Omega$ . Thus  $\{u < v + \delta\} \Subset \Omega$ . Let  $\mathcal{E}_0 \ni u_k \downarrow u$  and  $\mathcal{E}_0 \ni v_j \downarrow v$  as in the definition of  $\mathcal{E}_p$ . Using Lemma 1 in [Xi1] we have

$$\begin{aligned} &\frac{1}{(n!)^2} \int_{\{u_k < v_j\}} (v_j - u_k)^n dd^c w_1 \wedge \dots \wedge dd^c w_n + \int_{\{u_k < v_j\}} (r - w_1)(dd^c v_j)^n \\ &\leq \int_{\{u_k < v_j\}} (r - w_1)(dd^c u_k)^n. \end{aligned}$$

Since  $\{u_k < v_j\}_{j \geq 1}$  decreases to  $\bigcap_{j=1}^{\infty} \{u_k < v_j\} \supset \{u_k < v\}$ , by Fatou lemma and Lemma 3.4 it follows that

$$\begin{aligned} &\frac{1}{(n!)^2} \int_{\{u_k < v\}} (v - u_k)^n dd^c w_1 \wedge \dots \wedge dd^c w_n + \int_{\{u_k < v\}} (r - w_1)(dd^c v)^n \\ &\leq \varliminf_j \left[ \frac{1}{(n!)^2} \int_{\{u_k < v_j\}} (v_j - u_k)^n dd^c w_1 \wedge \dots \wedge dd^c w_n + \int_{\{u_k < v_j\}} (r - w_1)(dd^c v_j)^n \right] \\ &\leq \varliminf_j \int_{\{u_k < v_j\}} (r - w_1)(dd^c u_k)^n \\ (6) \quad &= \int_{\{u_k \leq v\}} (r - w_1)(dd^c u_k)^n \end{aligned}$$

for all  $k \geq 1$ . By applying the Lebesgue monotone convergence theorem to the two sides of (6) we obtain the inequality

$$\begin{aligned}
& \frac{1}{(n!)^2} \int_{\{u < v\}} (v-u)^n dd^c w_1 \wedge \dots \wedge dd^c w_n + \int_{\{u < v\}} (r-w_1)(dd^c v)^n \\
(7) \quad & \leq \overline{\lim}_k \int_{\{u_k \leq v\}} (r-w_1)(dd^c u_k)^n \\
& \leq \overline{\lim}_k \int_{\{u \leq v\}} (r-w_1)(dd^c u_k)^n.
\end{aligned}$$

Now let  $\varepsilon > 0$  be given. Take an open subset  $G \subset \Omega$  with  $\sup_k \int_G (dd^c u_k)^n < \varepsilon$  and  $u, v$  continuous on  $F = \Omega \setminus G$  as in Lemma 3.4. From the weak convergence of  $\{(r-w_1)(dd^c u_k)^n\}$  to  $(r-w_1)(dd^c u)^n$  and the compactness of  $\{u \leq v\} \cap F$  it follows that

$$\begin{aligned}
& \frac{1}{(n!)^2} \int_{\{u < v\}} (v-u)^n dd^c w_1 \wedge \dots \wedge dd^c w_n + \int_{\{u < v\}} (r-w_1)(dd^c v)^n \\
(8) \quad & \leq \overline{\lim}_k \int_{\{u \leq v\} \cap F} (r-w_1)(dd^c u_k)^n + r\varepsilon \\
& \leq \int_{\{u \leq v\}} (r-w_1)(dd^c u)^n + r\varepsilon.
\end{aligned}$$

Then the inequality

$$\begin{aligned}
& \frac{1}{(n!)^2} \int_{\{u < v\}} (v-u)^n dd^c w_1 \wedge \dots \wedge dd^c w_n + \int_{\{u < v\}} (r-w_1)(dd^c v)^n \\
(9) \quad & \leq \int_{\{u \leq v\}} (r-w_1)(dd^c u)^n
\end{aligned}$$

holds if in (8)  $\varepsilon$  tends to 0. Theorem 3.1 follows if we apply (9) to  $\lambda v$ ,  $\lambda > 1$  and notice that  $\{u < \lambda v\} \uparrow \{u < v\}$  and  $\{u \leq \lambda v\} \uparrow \{u < v\}$  as  $\lambda \downarrow 1$ .  $\square$

Similarly we get the following.

**Theorem 3.2.** *Let  $u \in \mathcal{E}_p, p \geq 1$  and  $v \in PSH^-(\Omega) \cap L^\infty(\Omega)$  satisfying  $\underline{\lim}_{z \rightarrow \partial\Omega} (u(z) - v(z)) \geq 0$ . Then the inequality*

$$\frac{1}{(n!)^2} \int_{\{u < v\}} (v-u)^n dd^c w_1 \wedge \dots \wedge dd^c w_n + \int_{\{u < v\}} (r-w_1)(dd^c v)^n \leq \int_{\{u < v\}} (r-w_1)(dd^c u)^n$$

holds for all  $r \geq 1$  and  $w_1, \dots, w_n \in PSH(\Omega)$ ,  $0 \leq w_j \leq 1$ ,  $j = \overline{1, n}$ .

Next we present the strong comparison principle for the class  $\mathcal{F}_p$ ,  $p \geq 1$ . Note that in Theorems 3.1 and 3.2 the strong comparison principle holds for the class  $\mathcal{E}_p$ ,  $p \geq 1$ , when  $u$  and  $v$  have to satisfy the condition  $\liminf_{z \rightarrow \partial\Omega} (u(z) - v(z)) \geq 0$ . However, in contrast to the class  $\mathcal{E}_p$  the above condition is superfluous for the class  $\mathcal{F}_p$ . Namely we prove the following result.

**Theorem 3.3.** *Let  $\Omega$  be a bounded hyperconvex domain in  $\mathbb{C}^n$  and  $u, v \in \mathcal{F}_p$ ,  $p \geq 1$ . Then for all  $r \geq 1$  and  $w_j \in PSH(\Omega)$ ,  $0 \leq w_j \leq 1$ ,  $1 \leq j \leq n$ , the inequality*

$$\frac{1}{(n!)^2} \int_{\{u < v\}} (v-u)^n dd^c w_1 \wedge \dots \wedge dd^c w_n + \int_{\{u < v\}} (r-w_1)(dd^c v)^n \leq \int_{\{u < v\}} (r-w_1)(dd^c u)^n$$

holds.

*Proof.* In the same notations as in the proof of Theorem 3.1 we get the inequality

$$(10) \quad \begin{aligned} & \frac{1}{(n!)^2} \int_{\{u < v\}} (v-u)^n dd^c w_1 \wedge \dots \wedge dd^c w_n + \int_{\{u < v\}} (r-w_1)(dd^c v)^n \\ & \leq \overline{\lim}_k \int_{\{u \leq v\}} (r-w_1)(dd^c u_k)^n \end{aligned}$$

and there exists an open subset  $G \subset \Omega$  such that  $\sup_k \int_G (dd^c u_k)^n < \varepsilon$  and  $u, v$  are continuous on  $F = \Omega \setminus G$  where  $\varepsilon > 0$  is given. Assume that  $g$  is any non-negative and continuous function which is bounded by 1 on  $\Omega$  and there exists a domain  $\Omega_0 \Subset \Omega$  such that  $g = 1$  on  $\Omega \setminus \overline{\Omega_0}$ . Then we infer that

$$\begin{aligned} & \overline{\lim}_k \int_{\{u \leq v\}} (r-w_1)(dd^c u_k)^n \\ & = \overline{\lim}_k \left( \int_{\{u \leq v\} \cap F} (r-w_1)(dd^c u_k)^n + \int_{\{u \leq v\} \cap G} (r-w_1)(dd^c u_k)^n \right) \\ & \leq \overline{\lim}_k \int_{\{u \leq v\} \cap F} (r-w_1)(dd^c u_k)^n + r\varepsilon \\ & \leq \overline{\lim}_k \left( \int_{\{u \leq v\} \cap F} (1-g)(r-w_1)(dd^c u_k)^n + \int_{\{u \leq v\} \cap F} g(r-w_1)(dd^c u_k)^n \right) + r\varepsilon \\ & \leq \overline{\lim}_k \int_{\{u \leq v\} \cap F \cap \overline{\Omega_0}} (r-w_1)(dd^c u_k)^n \end{aligned}$$

$$(11) \quad + \overline{\lim}_k \left( r \int_{\Omega} (g-1)(dd^c u_k)^n + r \int_{\Omega} (dd^c u_k)^n \right) + r\varepsilon.$$

However, since  $u_k \geq u$  on  $\Omega$  and  $u_k, u \in \mathcal{F}_p$ , from Lemma 4.2 in [Ce1] it follows that for all  $k \geq 1$ ,

$$(12) \quad \int_{\Omega} (dd^c u_k)^n \leq \int_{\Omega} (dd^c u)^n.$$

Combining (12) with (11), from the compactness of  $\{u \leq v\} \cap F \cap \overline{\Omega_0}$ , Lemma 3.3 and  $g-1 \in C_0(\Omega)$  it follows that the right-side of (10) does not exceed

$$(13) \quad \begin{aligned} & \int_{\{u \leq v\}} (r-w_1)(dd^c u)^n + r \int_{\Omega} (g-1)(dd^c u)^n + r \int_{\Omega} (dd^c u)^n + r\varepsilon \\ &= \int_{\{u \leq v\}} (r-w_1)(dd^c u)^n + r \int_{\Omega} g(dd^c u)^n + r\varepsilon. \end{aligned}$$

From (13) and (10) we get the inequality

$$\begin{aligned} & \frac{1}{(n!)^2} \int_{\{u < v\}} (v-u)^n dd^c w_1 \wedge \dots \wedge dd^c w_n + \int_{\{u < v\}} (r-w_1)(dd^c v)^n \\ & \leq \int_{\{u \leq v\}} (r-w_1)(dd^c u)^n + r \int_{\Omega} g(dd^c u)^n + r\varepsilon. \end{aligned}$$

To complete the proof of the Theorem 3.3 we let  $g$  and  $\varepsilon$  tend to 0 and use the same argument as in the proof of Theorem 3.1.  $\square$

Repeating the proof of Theorem 3.3 we obtain the following result.

**Theorem 3.4.** *Let  $u \in \mathcal{F}_p$  and  $v \in PSH^-(\Omega) \cap L^\infty(\Omega)$ . Then for all  $r \geq 1$  and  $w_1, \dots, w_n \in PSH(\Omega), 0 \leq w_j \leq 1, j = \overline{1, n}$ , the inequality*

$$\frac{1}{(n!)^2} \int_{\{u < v\}} (v-u)^n dd^c w_1 \wedge \dots \wedge dd^c w_n + \int_{\{u < v\}} (r-w_1)(dd^c v)^n \leq \int_{\{u < v\}} (r-w_1)(dd^c u)^n$$

holds.

#### 4. THE WEAK CONTINUITY OF THE COMPLEX MONGE-AMPÈRE OPERATOR IN THE CLASS $\mathcal{F}_p$

The aim of this section is to apply the results of the above section to the investigation of the weak continuity of the complex Monge-Ampère operator in the class  $\mathcal{F}_p$ . Namely we prove the following.

**Theorem 4.1.** *Let  $\{u_j\}$ ,  $u$  be in  $\mathcal{F}_p$ ,  $p \geq 1$  and  $u_j \rightarrow u$  in the  $C_n$ -capacity on every compact set of  $\Omega$ . Assume that*

$$\lim_{j \rightarrow \infty} C_n(\{z \in \Omega : |u_j(z) - u(z)| \geq \alpha\}) = 0$$

*for some  $\alpha > 0$  and  $(dd^c u_j)^n$  is uniformly absolutely continuous with respect to the  $C_n$ -capacity in  $\Omega$ . Then  $(dd^c u_j)^n$  converges weakly to  $(dd^c u)^n$  and  $(dd^c u)^n \ll C_n$  in  $\Omega$ .*

*Proof.* Given  $\Phi \in C_0(\Omega)$ , we may assume that

$$\|\Phi\| = \sup\{|\Phi(z)| : z \in \Omega\} \leq 1.$$

To see that  $(dd^c u_j)^n$  converges weakly to  $(dd^c u)^n$  we need to show that

$$A = \int_{\Omega} \Phi [(dd^c u_j)^n - (dd^c u)^n] \rightarrow 0 \text{ as } j \rightarrow \infty.$$

Given  $\varepsilon > 0$ . By the hypothesis there exists  $\delta > 0$  such that

$$(14) \quad \int_E (dd^c u_j)^n < \frac{\varepsilon}{1 + 2^n (n!)^2}$$

for all  $E \subset \Omega$  with  $C_n(E) < \delta$  and  $j \geq 1$ .

For each  $c > 0$  as in [Xi2] we write  $A = A_1 + A_2 + A_3$  where

$$\begin{aligned} A_1 &= \int_{\Omega} \Phi [(dd^c u_j)^n - (dd^c \max(u_j, -c))^n], \\ A_2 &= \int_{\Omega} \Phi [(dd^c \max(u_j, -c))^n - (dd^c \max(u, -c))^n], \\ A_3 &= \int_{\Omega} \Phi [(dd^c \max(u, -c))^n - (dd^c u)^n]. \end{aligned}$$

Since  $\max(u, -c) \in \mathcal{F}_p$  and  $\max(u, -c) \downarrow u$  as  $c \rightarrow +\infty$ , by Corollary 3.8 in [Per] we can find  $c_0 > 0$  such that  $|A_3| < \varepsilon$  for  $c > c_0$ .

Consider  $A_1$ . By Lemma 5.4 in [Ce2] we infer that

$$|A_1| \leq \int_{\{u_j \leq -c\}} (dd^c u_j)^n + \int_{\{u_j \leq -c\}} (dd^c \max(u_j, -c))^n.$$

Applying Theorem 3.4 we get

$$\begin{aligned}
\int_{\{u_j \leq -c\}} (dd^c \max(u_j, -c))^n &\leq \int_{\{u_j \leq -c\}} \left(-1 - \frac{2u_j}{c}\right)^n (dd^c \max(u_j, -c))^n \\
&\leq 2^n \int_{\{u_j < -\frac{c}{2}\}} \left(-\frac{c}{2} - u_j\right)^n (dd^c \max(\frac{u_j}{2}, -1))^n \\
&\leq 2^n (n!)^2 \int_{\{u_j < -\frac{c}{2}\}} (dd^c u_j)^n.
\end{aligned}$$

Hence,

$$|A_1| < (1 + 2^n (n!)^2) \int_{\{u_j < -\frac{c}{2}\}} (dd^c u_j)^n.$$

From Lemma 3.1 it follows that  $\lim_{c \rightarrow +\infty} C_n(\{u < -\frac{c}{4}\}) = 0$ , hence we may assume that for  $c > c_0$ ,

$$C_n(\{u < -\frac{c}{4}\}) < \frac{\delta}{2}.$$

Since  $\lim_{j \rightarrow \infty} C_n(\{|u_j - u| \geq \alpha\}) = 0$ , there exists  $j_0$  such that for  $j > j_0$  we have

$$C_n(\{|u_j - u| \geq \alpha\}) < \frac{\delta}{2}.$$

Take  $c_1 > 4(c_0 + \alpha)$ . Then

$$\{|u_j - u| > \frac{c_1}{4}\} \subset \{|u_j - u| \geq \alpha\}$$

and, consequently, for  $j > j_0$  we have

$$C_n(\{|u_j - u| > \frac{c_1}{4}\}) < \frac{\delta}{2}.$$

Hence, for  $j > j_0$  we get

$$(15) \quad C_n(\{u_j < -\frac{c_1}{2}\}) < \delta.$$

From the hypothesis on the uniformly absolute continuity of  $(dd^c u_j)^n$  with respect to  $C_n$ -capacity and (14), (15) it follows that  $|A_1| < \varepsilon$  for  $j > j_0$ . But since the inclusion

$$\left\{ \left| \max(u_j, -c) - \max(u, -c) \right| > \beta \right\} \subset \{|u_j - u| > \beta\}$$

holds for all  $\beta > 0$ ,  $\max(u_j, -c) \rightarrow \max(u, -c)$  in the  $C_n$ -capacity on every compact set of  $\Omega$ . Hence, by [Xi1]  $|A_2| < \varepsilon$  for  $j > j_1 > j_0$  and, consequently,  $|A| < 3\varepsilon$  for  $j > j_0$ . It remains to show that  $(dd^c u)^n \ll C_n$  in  $\Omega$ .

Given  $\varepsilon > 0$ . By the hypothesis there exists  $\delta > 0$  such that for all  $E \subset \Omega$ ,  $C_n(E) < \delta$  and all  $j \geq 1$ ,  $\int_E (dd^c u_j)^n < \varepsilon$ .

Assume that  $E$  is a Borel subset of  $\Omega$  with  $C_n(E) < \delta$ . Take an open set  $G \subset \Omega$ ,  $E \subset G$  with  $C_n(G) < \delta$ . Then

$$\int_E (dd^c u)^n \leq \int_G (dd^c u)^n \leq \liminf_j \int_G (dd^c u_j)^n < \varepsilon$$

and hence,  $(dd^c u)^n \ll C_n$  in  $\Omega$ . Theorem 4.1 is proved. □

### 5. THE DIRICHLET PROBLEM FOR THE CLASS $\mathcal{F}_p(h)$

In this section we are interested in the following Dirichlet problem in the class  $\mathcal{F}_p(h)$ . Suppose that  $\Omega$  is a bounded hyperconvex domain in  $\mathbb{C}^n$ ,  $h \in C(\partial\Omega)$  and  $\mu$  is a positive Borel measure on  $\Omega$ . Find a psh function  $u$  on  $\Omega$  such that

$$(*) \quad \begin{cases} (dd^c u)^n = \mu \\ \lim_{z \rightarrow \xi} u(z) = h(\xi), \quad \forall \xi \in \partial\Omega. \end{cases}$$

In the case  $\Omega$  is a strictly pseudoconvex domain, Bedford and Taylor (see [Be-Ta1]) showed that if  $\mu = fd\lambda$ ,  $0 \leq f \in C(\bar{\Omega})$ ,  $d\lambda$  is the Lebesgue measure in  $\mathbb{C}^n$ , then (\*) has an unique solution  $u \in PSH(\Omega) \cap C(\bar{\Omega})$ . This was extended in [Ce1] as follows. If  $\mu = fd\lambda$ ,  $0 \leq f \in L^\infty(\Omega)$ , then (\*) has an unique solution  $u \in PSH(\Omega) \cap L^\infty(\Omega)$ . Next in [Ce-Sa] they have shown that if  $\mu = fd\lambda$ ,  $0 \leq f \in L^\infty_{loc}(\Omega)$  and there exists a function  $w \in PSH(\Omega) \cap L^\infty(\Omega)$  such that  $fd\lambda \leq (dd^c w)^n$ , then (\*) has a solution  $u \in PSH(\Omega) \cap L^\infty(\Omega)$ . Here, by relying on some recent results concerning with the class  $\mathcal{F}_p(h)$  in [Ce3] and [Ah] we solve (\*) in the class  $\mathcal{F}_p(h)$ . More precisely we prove the following

**Theorem 5.1.** *Let  $\Omega$  be a strictly pseudoconvex domain in  $\mathbb{C}^n$ ,  $n \geq 2$ ,  $f \in L^1(\Omega)$  and  $h \in C(\partial\Omega)$  such that  $\lim_{z \rightarrow \xi} U(0, h)(z) = h(\xi)$  for all  $\xi \in \partial\Omega$ . Assume that  $fd\lambda \leq (dd^c v)^n$  for some  $v \in \mathcal{F}_p(h)$ ,  $p \geq 1$ . Then there exists  $u \in \mathcal{F}_p(h)$  such that  $(dd^c u)^n = fd\lambda$ .*

*Proof.* Without loss of generality we may assume that  $h \leq 0$ . Take an increasing sequence of simple functions  $f_k \uparrow f$ . By [Ce1], for each  $k \geq 1$  there exists  $u_k \in PSH(\Omega) \cap L^\infty(\Omega)$  such that  $(dd^c u_k)^n = f_k d\lambda$  and  $\lim_{z \rightarrow \xi} u_k(z) = h(\xi)$  for all  $\xi \in \partial\Omega$ . By the comparison principle in [Be-Ta2] it follows that  $u_k \geq u_{k+1}$  on  $\Omega$  for  $k \geq 1$ . Set  $u(z) = \lim_{k \rightarrow \infty} u_k(z)$ ,  $z \in \Omega$ . First we show that  $u \in \mathcal{F}_p(h)$ . Since  $v \in \mathcal{F}_p(h)$ , it follows that there exists  $\varphi \in \mathcal{F}_p$  such that  $U(0, h) \geq v \geq \varphi + U(0, h)$ .

On the other hand, since  $\varphi \in \mathcal{F}_p$ , there exists a sequence of continuous psh functions  $\varphi_j \in \mathcal{E}_0$ ,  $\varphi_j \downarrow \varphi$ . Let  $p(z) = \frac{\|z\|^2}{4}$ ,  $z \in \mathbb{C}^n$ . Then  $(dd^c p)^n = n!d\lambda$ . Choose  $\varepsilon > 0$  and  $\delta > 0$  such that  $v_{\varepsilon\delta} < v$  on  $\bar{\Omega}$ , where  $v_{\varepsilon\delta} = v + \varepsilon p - \delta$ . Next,

for  $j \geq 1$  put

$$v_j = \max(v, \varphi_j + U(0, h)) + \varepsilon p - \delta \in \text{PSH} \cap L^\infty(\Omega)$$

and  $v_j \downarrow v_{\varepsilon\delta}$ . We prove that  $\lim_{s \rightarrow \infty} s^n C_n(\{v_{\varepsilon\delta} < -s\}) = 0$ . Indeed, let  $M = \sup_{z \in \bar{\Omega}} p(z)$ . Then

$$\{v_{\varepsilon\delta} < -s\} = \{v + \varepsilon p < \delta - s\} \subset \{v < \delta - s - \varepsilon M\}.$$

Hence, it remains to show that

$$\lim_{s \rightarrow \infty} s^n C_n(\{v < -s\}) = 0.$$

Since  $\varphi + U(0, h) \leq v$  we get

$$\{v < -s\} \subset \{\varphi + U(0, h) < -s\}.$$

Therefore,

$$s^n C_n(\{\varphi + U(0, h) < -s\}) \leq s^n C_n\{\varphi < -\frac{s}{2}\} + s^n C_n\{U(0, h) < -\frac{s}{2}\}.$$

Since  $\varphi \in \mathcal{E}_p$  and Lemma 3.1 implies that

$$\lim_{s \rightarrow \infty} s^n C_n(\{\varphi < -\frac{s}{2}\}) = 0.$$

Notice that because  $h \in C(\partial\Omega)$ ,  $U(0, h) \in C(\bar{\Omega})$  by [Wa]. Hence for sufficiently large  $s > 0$  the set  $\{U(0, h) < -s\} = \emptyset$ . Thus

$$\lim_{s \rightarrow \infty} s^n C_n(\{U(0, h) < -s\}) = 0.$$

Now by Lemma 3.2 we have  $(dd^c v_j)^n \ll C_n$  in  $\Omega$  uniformly for  $j \geq 1$ . Since  $\lim_{z \rightarrow \partial\Omega} (u_k(z) - v_{\varepsilon\delta}(z)) \geq 0$  (we choose  $\varepsilon$  and  $\delta$  sufficiently small so that  $\varepsilon M - \delta \leq 0$ ), using the arguments of the proof of the comparison principle (see Theorem 4.1 in [Be-Ta2]) we get

$$\begin{aligned} \int_{\{u_k < v_{\varepsilon\delta}\}} (dd^c v)^n &\leq \int_{\{u_k < v_{\varepsilon\delta}\}} (dd^c v)^n + \int_{\{u_k < v_{\varepsilon\delta}\}} (dd^c(\varepsilon p - \delta))^n \\ &\leq \int_{\{u_k < v_{\varepsilon\delta}\}} (dd^c v_{\varepsilon\delta})^n \leq \int_{\{u_k < v_{\varepsilon\delta}\}} (dd^c u_k)^n \leq \int_{\{u_k < v_{\varepsilon\delta}\}} (dd^c v). \end{aligned}$$

Hence  $\int_{\{u_k < v_{\varepsilon\delta}\}} (dd^c p)^n = 0$ . This shows that  $v_{\varepsilon\delta} \leq u_k$  for all  $k \geq 1$ . Letting  $k \rightarrow +\infty$  and  $\varepsilon, \delta \downarrow 0$  we obtain that  $\varphi + U(0, h) \leq u \leq U(0, h)$ . Thus  $u \in \mathcal{F}_p(h)$ . Since  $\mathcal{F}_p(h) \subset \mathcal{E}_p(h)$  and  $h \leq 0$ , Lemma 4.9 in [Ah] implies that  $u \in \mathcal{E}$ . On the other hand,  $0 \geq u_k \in \text{PSH} \cap L^\infty(\Omega)$ ,  $u_k \downarrow u$ ,  $u \in \mathcal{E}$ . Hence Theorem 4.5 in [Ce3] implies that  $(dd^c u_k)^n$  converges weakly to  $(dd^c u)^n$ . Hence  $(dd^c u)^n = fd\lambda$ . Theorem 5.1 is completely proved.  $\square$

**Remark 5.1.** There exists  $f \in L^1(\Omega)$  such that  $f d\lambda$  is not a complex Monge-Ampère measure  $(dd^c u)^n$  for any  $u \in \mathcal{E}_1$ . Indeed, take a sequence  $\{z_j\}$  of distinguished points in  $\Omega$  converging to  $\xi \in \partial\Omega$ . Then we can find  $r_j \downarrow 0$  such that  $\mathbb{B}(z_j, r_j)$  are pairwise disjoint and  $j^{2(n+1)} C_n(\mathbb{B}(z_j, r_j)) \rightarrow 0$  as  $j \rightarrow \infty$ . Consider the integrable function  $f$  on  $\Omega$  given by

$$f = \sum_{j=1}^{\infty} \frac{1}{d_n r_j^{2n} j^2} \chi_{\mathbb{B}(z_j, r_j)},$$

where  $d_n$  is the volume of the unit ball in  $\mathbb{C}^n$ . Assume that there exists  $u \in \mathcal{E}_1$  such that  $f d\lambda = (dd^c u)^n$ . Take a sequence  $\mathcal{E}_0 \ni u_k \downarrow u$  as the definition of  $\mathcal{E}_1$ . By Lemma 3.3,  $\{-\varphi(dd^c u_k)^n\} \rightarrow (-\varphi)(dd^c u)^n$  weakly for  $\varphi \in \mathcal{E}_0(\Omega)$ . Theorem 4.2 in [Ce2] implies that

$$(16) \quad \int (-\varphi)(dd^c u)^n \leq \varliminf_k \int (-\varphi)(dd^c u_k)^n \leq A \left( \int (-\varphi)(dd^c \varphi)^n \right)^{\frac{1}{n+1}},$$

where

$$A = D_{0,1} \sup_k \left( \int (-u_k)(dd^c u_k)^n \right)^{\frac{1}{n+1}} < \infty.$$

Applying (16) to  $\varphi = h_{\overline{\mathbb{B}(z_j, r_j)}}$ , where  $h_{\overline{\mathbb{B}(z_j, r_j)}}$  is the relatively extremal function with respect to  $\overline{\mathbb{B}(z_j, r_j)}$ , we get the following inequalities

$$\begin{aligned} \frac{1}{j^2} &= \int_{\overline{\mathbb{B}(z_j, r_j)}} f d\lambda = \int_{\overline{\mathbb{B}(z_j, r_j)}} -h_{\overline{\mathbb{B}(z_j, r_j)}} f d\lambda \leq \int_{\Omega} -h_{\overline{\mathbb{B}(z_j, r_j)}} f d\lambda \\ &\leq A \left( \int_{\Omega} -h_{\overline{\mathbb{B}(z_j, r_j)}} (dd^c h_{\overline{\mathbb{B}(z_j, r_j)}})^n \right)^{\frac{1}{n+1}} \\ &\leq A \left( \int_{\overline{\mathbb{B}(z_j, r_j)}} (dd^c h_{\overline{\mathbb{B}(z_j, r_j)}})^n \right)^{\frac{1}{n+1}} = A C_n(\overline{\mathbb{B}(z_j, r_j)})^{\frac{1}{n+1}}. \end{aligned}$$

Hence

$$\varliminf_j j^2 C_n(\overline{\mathbb{B}(z_j, r_j)})^{\frac{1}{n+1}} \geq \frac{1}{A} > 0.$$

We reach a contradiction because  $j^{2(n+1)} C_n(\overline{\mathbb{B}(z_j, r_j)}) \rightarrow 0$ .

**Remark 5.2.** In [Ce2, Theorem 7.7], under the assumption that  $\Omega$  is a smoothly bounded, strictly pseudoconvex domain in  $\mathbb{C}^n$ ,  $n \geq 2$ ,  $p \geq 1$ ,  $\mu$  is a positive measure on  $\Omega$  with finite mass and  $h \in C^\infty(\partial\Omega)$ , Cegrell has shown that  $\mu = (dd^c u)^n$  for some  $u \in \mathcal{F}_p(h)$  if and only if there is a constant  $A$  such that

$$\int_{\Omega} (-\varphi)^p d\mu \leq A \left( \int_{\Omega} (-\varphi)^p (dd^c \varphi)^n \right)^{\frac{p}{n+p}}, \quad \forall \varphi \in \mathcal{E}_0.$$

In the proof of the above result of Cegrell the hypothesis  $h \in C^\infty(\partial\Omega)$  is an essential condition because under this hypothesis the function  $U(0, -h) + U(0, h) \in \mathcal{E}_0$

and the arguments in the proof of the author is suitable. However, in Theorem 5.1 above we give a weaker hypothesis that  $h \in C(\partial\Omega)$  and hence we obtain a weaker result than Theorem 7.7 in [Ce2].
